****THC/CBD Conversion** indicates the percentage of total cannabinoid that was already converted to active cannabinoid at the time of testing. 100% indicates that all cannabinoid present was in the active, decarboxylated form at the time of testing.

N/D = Not Detected. The level of analyte was below the detection threshold for this test.

LLOQ = Lower Limit of Quantitation. <LLOQ signifies that the analyte was detected at a concentration below the calibrated range of the method and could not be accurately measured.

Potency is determined by assessing the accuracy of the test result against the potency claim on the container. To pass, the average result must differ by no more than +/-15% from the claim.

Homogeneity is determined by calculating the variance of the four replicate measurements. To pass, the relative standard deviation (RSD) must be less than 10% and each replicate must be within +/-15% of the claim. Any cannabinoid that makes up less than 10% of the total amount of cannabinoids in the product is not subject to these requirements.
